

March 10, 2016

This figure was prepared as a caution advisory for the neighbors' living near the proposed Swanton Wind Farm. The circles represent the recommended turbine setback distances recommended by the Cape Cod Commission (MA); radius equals 10 times the turbine height. This is an easy "rule of thumb" that can be used to identify the high potential for noise complaints. I have found this to be a reliable screening tool for wind turbine sites in quiet rural environments where people live.
