

AI Talking Points

In development...

Future of AI, per the Investment\$

The Future Of A.I.

Forecasted cumulative global artificial intelligence revenue 2016-2025, by use case (U.S. dollars)

Considerations/Recommendations for

Debate and clarify (rules) the desired outcomes.

Government

Policing and legislating AI will require software and probably other AI.
Making government dependent on Private Enterprise to police other private enterprise.

Understand the implications of studying populations vs individuals (studying individuals can stray towards profiling).

Any application of AI should be tested against human determinations before becoming regulation, law or government policy.

Understand that Algorithms are Intellectual Property (IP) and that by using AI government will be engaged in developing valuable IP – how we share, monetize or enable economic activity should be understood.

Considerations/Recommendations for Government (continued)

1. Understand that AI will lack some degree of nuance and inherent bias towards expecting a repeat of past experiences
2. Vulnerability to CyberAttack
3. Private Industry seems behind the curve on self-regulating or developing standards. Some companies have joined groups to do this (such as AI Now) but are not yet following recommendations themselves.
