How Vermont Fish & Wildlife Hatcheries are saving energy, lowering costs, and reducing carbon pollution

Financial Savings of Vermont Fish Hatchery Energy Efficiency Projects

(2006 - projected 2018)

\$1.37 million in energy savings will be realized over the lifetime of the hatchery projects.

Young landlocked Atlantic salmon at Ed Weed hatchery are raised in a new tank system that recirculates water, saving water use and the propane needed to heat it.

A solar panel array installed at the Bald Hill hatchery is producing approximately 34,000 kWh annually and will generate \$160,000 over the 25 year expected lifetime of the panels.
