

2021 CELT Report

2021-2030 Forecast Report of Capacity, Energy,
Loads, and Transmission

© ISO New England Inc.
System Planning

May 1, 2021

Table of Contents

Introduction

Section 1 Summaries

- 1.1 Summer Peak Capabilities and Load Forecast
- 1.2 Winter Peak Capabilities and Load Forecast
- 1.3 Summary of Summer Capacity Supply Obligation by Fuel/Unit Classification
- 1.4 Summary of Winter Capacity Supply Obligation by Fuel/Unit Classification
- 1.5 Load and Energy Forecast
 - 1.5.1 Actual and Forecast Peak Loads
 - 1.5.2 Actual and Forecast Annual Energy Use
- 1.6 Seasonal Peak Load Forecast Distributions Accounting for Weather
- 1.7 Electrification Forecast

Section 2 Control Area Capability

- 2.1 List of Generators' Existing and Expected Seasonal Claimed Capability
- 2.2 Net of Imports and Exports
- 2.3 Primary Natural Gas Pipeline Connection by Asset

Section 3 Forecast of Photovoltaic (PV) Resources

- 3.1 Forecast of Photovoltaic Resources by Category and State
- 3.2 Forecast of Cumulative Behind-the-Meter Photovoltaic Estimated Summer Seasonal (July 1) Peak Load Reduction by State
- 3.3 Forecast of Behind-the-Meter Photovoltaic Energy (GWh) by State

Section 4 FCM Summary Tables

- 4.1 Summary of Capacity Supply Obligations
- 4.2 Summary of Renewable Technology Resource Allotments in Forward Capacity Market
- 4.3 FCA 15 Qualified and Cleared Capacity

Section 5 Resource Interconnection Capabilities

- 5.1 Network Resource Capability and Capacity Network Resource Capability; Effective June 1, 2021 for data as of April 3, 2021
- 5.2 Demand Capacity Resource (MW) Used in System Planning Studies

Section 6 Transmission Information

- 6.1 Transmission Project Links
- 6.2 Forecasts Used in Transmission Planning

Appendices

- A.1 Resources
 - Acronyms, Abbreviations, and Definitions
 - Gross Load Forecast Adjustments for the ICR Calculation Upcoming FCM Annual Reconfiguration Auctions
 - Prime Mover and Energy Codes
 - Energy Source
 - FIPS Codes
- A.2 References

CELT Report Introduction

The Forecast Report of Capacity, Energy, Loads, and Transmission (CELT Report) presents a range of data about the ISO New England (ISO or ISO-NE) Reliability Coordinator Area; the data in the CELT Report are used as assumptions in power system planning and operations reliability studies.¹ The 2021 CELT Report reflects demographic, economic, and market information available from 2021 through winter 2030-2031, including the scheduled and proposed transmission changes, project listings, and summaries of future resources. This CELT edition supersedes prior CELT publications; it represents the efforts of Market Participants' working jointly with the ISO, under the review of the New England Power Pool's (NEPOOL) Reliability Committee and its subcommittee, the Load Forecast Committee.

Links: [*Reliability Committee*](#)
 [*Load Forecast Committee*](#)

Data and Information Provided

The 2021 CELT Report includes the following information and data for the ISO New England Reliability Coordinator Area for 2021 to 2030:

- 10-year projections of summer and winter peak loads (i.e., demand), annual and monthly energy use, seasonal and annual demand from the heating and transportation sectors, and seasonal and annual load reductions from energy efficiency and behind-the meter (BTM) solar photovoltaic (PV) resources. The actual annual energy use and monthly peak loads are available for 2020
- Summer and winter capacity supply obligations (CSOs) by fuel/unit classification and load zone for the 2020-2021 to 2024-2025 capacity commitment periods (CCPs), as of March 31, 2021, for new and existing generating resources, demand capacity resources, and imports. The generating and demand capacity resource CSO totals for the 2024-2025 CCP are assumed to remain in place for the remainder of the CELT reporting period. Imports beyond the 2024-2025 CCP reflect only known, long-term, firm contracts
- Forecasts of energy and demand impacts of heating and transportation electrification by state
- Generator seasonal claimed capability (SCC) for all assets in service as of April 1, 2021, with a snapshot of the winter SCC for both January 1, 2021 and at the time of the 2020-2021 winter peak SCC (which occurred on December 17, 2020), as well as the 2021 projected summer peak SCC as of July 1, 2021 for existing and new assets. Net capacity of imports and exports is also provided
- Forecasts of PV resource nameplate capacity by category (i.e., in market and BTM) and state
- Annual BTM PV energy production by state
- Renewable technology resource (RTR) allotments in the Forward Capacity Market (FCM) for Forward Capacity Auctions (FCAs) 9 to 15
- Qualified and cleared resource capacity for all resources that participated in FCA 15
- Summer and winter network resource capability (NRC) and capacity network resource capability (CNRC) as of April 1, 2021, effective June 1, 2021
- Forecast data the ISO uses for transmission planning

The report includes links to the Regional System Plan Project List and Asset Condition List, containing the final RSP21 Project List and Asset Condition lists dated March 2021; a link to the list containing the current status of the new and modified jurisdictional interconnection requests; and a link to transmission owner local system plans, which are updated annually.

 [*RSP Asset Condition List*](#)
 [*Interconnection Request Queue*](#)
 [*Transmission Owner Planning Advisory Committee*](#)

Appendices in this report are as follows:

- Appendix A provides:
 - Links to the acronyms, abbreviations, and definitions of power system terms used in this report, including subareas and load zones
 - A table of the gross load forecast adjustments that will be used in the ICR Calculations for the upcoming FCM annual reconfiguration auctions
 - A list of the Federal Information Processing Standard (FIPS) county codes
 - The U.S. Energy Information Administration (EIA) prime mover and energy source (i.e., fuel types) codes
- Appendix B provides a list of references, links to all the CELT Reports, and full details about the forecasts and other relevant documents

Links: [*Glossary and Acronyms*](#)
 [*CELT Reports*](#)

Additional Information

Note that the ISO New England Inc. Transmission, Markets, and Services Tariff, as well as the ISO-NE manuals and procedures (e.g., ISO and system operating procedures, master and local control center procedures, and planning procedures) contain detailed definitions and explanations of power system and market terms and that the ISO's Glossary and Acronyms list contains more concise definitions of these terms. In case of any discrepancy among the various materials referenced in this report, the ISO Tariff or Manual definition takes precedence.

Contact ISO New England Participant Support and Solutions at AskISO@iso-ne.com or (413) 540-4220 with any questions or comments regarding the information contained herein.

1. ISO New England is the Reliability Coordinator, Balancing Authority, and Transmission Operator for New England. Throughout this document, the ISO is referred to as the reliability coordinator, with the understanding that the reliability coordinator has responsibility for overseeing the other two functions.

1.1 Summer Peak Capabilities and Load Forecast (MW)

This table shows the summer peak capabilities and peak load forecast for 2020 to 2030. Values shown may not sum correctly due to rounding.

More information on the 2021 CELT forecast is available on the following ISO New England webpages:

2.2.2.1 Energy Efficiency	2,626	2,795	3,040	3,015	2,984	2,984	2,984	2,984	2,984	2,984	2,984
2.2.2.2 Distributed Generation	165	138	257	265	193	193	193	193	193	193	193
2.3 Imports ⁽¹²⁾	1,125	1,208	1,292	1,059	1,487	1,487	1,487	1,487	1,487	1,487	1,487
2.4 Total $[= 2.1 + 2.2 + 2.3]$	35,042	34,722	34,135	33,930	34,619	34,619	34,619	34,619	34,619	34,619	34,619
3. Capacity based on seasonal claimed capability ^(13,14)											
3.1 Generation claimed for capability	31,718	31,493	31,227	31,385	31,212	31,267	31,303	31,325	31,339	31,352	31,364
3.1.1 Generator Additions		0	258	562	1,950	2,005	2,041	2,063	2,077	2,090	2,101
3.1.2 Generator Retirements		0	523	670	2,230	2,230	2,230	2,230	2,230	2,230	2,230
4. Reserves (based on Reference Load with reduction for passive DCR)											
4.1 Installed reserves (based on CSOs of generating resources [line 2.1], active DCR [line 2.2.1], and imports [line 2.3])											
4.1.1 MW $[= 2.1 + 2.2.1 + 2.3 - 1.3]$	7,495	6,590	5,943	5,899	6,734	6,854	6,927	6,948	6,915	6,832	6,610
4.1.2 % of load $[= (4.1.1 / 1.3) \times 100]$	30	27	24	24	27	28	28	28	28	28	27
4.2 Installed reserves (based on generation SCC [line 3.1], active DCR [line 2.2.1], imports [line 2.3], and exports ⁽¹⁵⁾)											
4.2.1 MW $[= (3.1 + 2.2.1 + 2.3) - 1.3]$	8,745	8,478	8,412	8,314	8,705	8,880	8,989	9,032	9,013	8,943	8,733
4.2.2 % of load $[= (4.2.1 / 1.3) \times 100]$	36	34	34	34	35	36	37	37	37	36	35

Footnotes for Section 1.1

1. Load levels represent the megawatts associated with a 50/50 gross peak demand forecast, which is a value within the distribution that peak demand has a 50% probability of exceeding in any summer period.
2. All forecast values reflect the forecasted impacts of electrification of the heating and transportation sectors.
3. The 2020 summer peak load shown reflects weather normalization. Before weather normalization, the actual net 2020 summer peak of 25,121 MW occurred on July 27, 2020 at hour ending (HE) 18:00 (6:00 p.m.). The 2020 gross annual peak (i.e., reconstituted for demand reductions from the load reducing action of energy efficiency (EE), behind-the-meter photovoltaics (BTM PV), and active demand capacity resources) of 29,090 MW occurred on July 28, 2020 at HE 14:00 (2:00 p.m.). See Section 1.5 for actual and forecast peaks and energy.
4. The “gross” load forecast reflects peak loads without reductions from EE and BTM PV.
5. Starting with the 2021 CELT, adjusted gross load forecast values are used in calculating the Installed Capacity Requirement for the ARAs. For each ARA, an adjustment is calculated, which is added on to the gross load forecast value for the capacity commitment period (CCP) in question. See Appendix A.1 for a table of these adjustments.
6. Line 1.1.1 consists of BTM PV estimated summer peak load reductions as of July 1 of that year, which include an 8% transmission and distribution loss gross up. Refer to Section 3.2 for more details on these values.
7. The EE values shown on line 1.2.1 are from the 2021 EE forecast. The 2020 value represents summer capacity supply obligations (CSO) for passive demand resources (PDR) from the primary forward capacity auction (FCA) for the capacity commitment periods (CCP) beginning June 1 of 2020. Values for the remaining years are forecast values.
8. The “net” load forecasts are developed by subtracting forecasts of BTM PV and EE from the 50/50 gross peak load forecasts.
9. The 2021 through 2024 capacity supply obligations (CSOs) for generating resources and demand capacity resources (DCRs) consist of the current Forward Capacity Market CSOs as of March 31, 2021, and the 2020 CSOs are based on the 2020-2021 ARA 3 results. The 2024 CSO is assumed to remain in place through the end of the CELT reporting period (2030).
10. The DCR values are based on DCRs with CSOs, which include an 8% transmission and distribution loss gross-up.
11. The Passive DR total also includes passive demand capacity resources with different measure types across project increments. Therefore, Energy Efficiency and Distributed Generation MW values will not sum to the Passive DR total.
12. The 2020 through 2024 imports are based on FCM import CSOs.
13. The generating capability based on seasonal claimed capability (SCC) values includes all existing ISO New England generating assets as well as projected additions and retirements. Future generating assets consist of non-FCM resources expected to go commercial in 2021 or 2022 and all new resources with FCM CSOs. The capabilities of the FCM resources are based on their summer qualified capacity. Also included is a forecast of non-FCM PV capacity, which is based on an average of the known PV SCC values divided by the average of their nameplate. The result is that non-FCM PV capacity is estimated as 34% of their nameplate.
14. The 2021 summer SCC value of 31,493 MW is consistent with the total capacity projected for July 1 in the Section 2.1 Generator List.
15. The generation capability value for 2020 accounts for a 100 MW Export Bid.

1.2 Winter Peak Capabilities and Load Forecast (MW)

This table shows the winter peak capabilities and peak load forecast for 2020 to 2030. Values shown may not sum correctly due to rounding.

More information on the 2021 CELT forecast is available on the following ISO New England webpages:

4.2 Installed Reserves - (based on generation SCC (line 3.1), active DCR (line 2.2.1), imports (line 2.3), and exports) ⁽¹⁴⁾											
4.2.1 MW $[= (3.1 + 2.2.1 + 2.3) - 1.3]$	16,027	15,222	14,975	14,878	14,781	13,282	13,161	12,963	12,686	12,330	11,898
4.2.2 % of load $[= (4.2.1 / 1.3) \times 100]$	83	77	76	76	75	67	66	65	62	59	56

Footnotes for Section 1.2

1. Load levels represent the megawatts associated with a 50/50 gross peak demand forecast, which is a value within the distribution that peak demand has a 50% probability of exceeding in any winter period.
2. All forecast values reflect the forecasted impact of electrification of the heating and transportation sectors.
3. The 2020-2021 winter peak load shown reflects weather normalization. Before weather normalization, the actual net 2020-2021 winter peak of 21,670 MW occurred on December 17, 2020 at hour ending 18:00. The 2020-2021 gross winter peak (i.e., reconstituted for the load reducing action of EE and active DCR) of 18,887 MW occurred on December 17, 2020 at hour ending 18:00. See Section 1.5 for actual and forecast peaks and energy.
4. The “gross” load forecast reflects peak loads without reductions from EE and BTM PV.
5. Starting with the 2021 CELT, adjusted gross load forecast values are used in calculating the Installed Capacity Requirement for the ARAs. For each ARA, an adjustment is calculated, which is added on to the gross load forecast value for the capacity commitment period (CCP) in question. See Appendix A.1 for a table of these adjustments.
6. BTM PV is assumed to be zero during the winter peak.
7. The EE values shown on line 1.2.1 are from the 2021 EE forecast. The 2020 value represents winter capacity supply obligations (CSO) for passive demand resources (PDR) from the primary forward capacity auction (FCA) for the capacity commitment periods (CCP) beginning June 1 of 2020. Values for the remaining years are forecast values.
8. The “net” load forecasts are developed by subtracting forecasts of BTM PV and EE from the 50/50 gross peak load forecasts.
9. The 2021-2022 through 2024-2025 capacities for generating resources and DCR consist of the CSOs current as of March 31, 2021, and the 2020-2021 CSOs are based on the ARA 3 results. The 2024-2025 CSO is assumed to remain in place through the end of the CELT reporting period.
10. The DCR values are based on DCR with CSOs, including an 8% transmission and distribution loss gross-up.
11. Energy Efficiency and Distributed Generation MW values will not sum to the Passive DR total because it also includes passive demand capacity resources with different measure types across project increments.
12. The 2020-2021 through 2024-2025 imports are based on FCM import CSOs. The imports beyond the 2024-2025 capacity commitment period reflect only known, long-term contracts.
13. The generating capability based on SCC values includes all existing ISO New England generating assets as well as projected additions and retirements. Future generating assets consist of non-FCM resources expected to go commercial in 2021 or 2022 and all new resources with FCM CSOs. The capabilities of the FCM resources are based on their winter qualified capacity.
14. The generation capability value for 2020 accounts for a 100 MW Export Bid.

1.3 Summary of Summer Capacity Supply Obligation by Fuel/Unit Classification (MW)

This table summarizes summer capacity supply obligations (CSOs) by fuel type for the 2020-2021 to 2030-2031 capacity commitment periods (CCPs) for the ISO New England Reliability Coordinator Area. For clarity, fuel cells were separated out from the natural gas fuel type, and pumped storage was separated out from the hydro fuel type. Subtotals are presented for generation, demand capacity resources, and imports. The imports also appear in Table 1.1 as a line item for the summer peak capabilities. Values shown may not sum correctly due to rounding.

Unit Fuel Type	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029
Battery, Energy Storage	6	34	30	17	612	612	612	612	612	612
Coal	821	438	438	438	438	438	438	438	438	438
Fuel Cell	23	31	31	24	24	24	24	24	24	24
Hydro	1,417	1,417	1,432	1,358	1,367	1,367	1,367	1,367	1,367	1,367
Landfill Gas/Other Biomass Gas	54	52	51	55	48	48	48	48	48	48
Natural Gas	15,574	15,543	15,117	15,505	14,485	14,485	14,485	14,485	14,485	14,485

Footnotes for Section 1.3

1. The 2020 through 2024 capacity values consist of the Forward Capacity Market CSOs current as of March 31, 2021, and the 2020 CSOs are based on the 2020-2021 ARA 3 results. The 2024 CSO is assumed to remain in place through the end of the CELT reporting period. The 1,144 MW of static, dynamic, and retirement (as applicable) delist bids cleared to leave the 2024-2025 Forward Capacity Auction are assumed to remain delisted through the reporting period.
2. Imports are from entities outside the ISO-NE Reliability Coordinator Area boundary. The 2020 through 2024 imports are based on FCM import CSOs. The generation capability values in CCP 2020-2021 account for an export delist of 100 MW. The imports beyond the 2024-2025 capacity commitment period reflect only known, long-term, firm contracts.

1.4 Summary of Winter Capacity Supply Obligation by Fuel/Unit Classification (MW)

This table summarizes winter capacity supply obligations (CSOs) by fuel type for the 2020-2021 to 2030-2031 capacity commitment periods (CCPs) for the ISO New England Reliability Coordinator Area. For clarity, fuel cells were separated out from the natural gas fuel type, and pumped storage was separated out from the hydro fuel type. Subtotals are presented for generation, demand capacity resources, and imports. The imports also appear in Table 1.2 as a line item for the winter peak capability. Values shown may not sum correctly due to rounding.

Unit Fuel Type	2020-21	2021-22	2022-23	2023-24	2024-25	2025-26	2026-27	2027-28	2028-29	2029-30	2030-31

Footnotes for Section 1.4

1. The 2020-2021 through 2024-2025 capacity values consist of the Forward Capacity Market CSOs as of March 31, 2021, and the 2020-2021 CSOs are based on the ARA 3 results. The 2024-2025 FCM CSO is assumed to remain in place through the end of the CELT reporting period. The 1,144 MW of static, dynamic, and retirement (as applicable) delist bids cleared to leave the 2024-2025 Forward Capacity Auction are assumed to remain delisted through the reporting period.
2. Imports are from entities outside the ISO-NE Reliability Coordinator Area boundary. The 2020-2021 through 2024-2025 imports are based on FCM import CSOs. An export delist of 100 MW is taken into account in the generation capability values in 2020-2021. The imports beyond the 2024-2025 capacity commitment period reflect only known, long-term, firm contracts.

1.5.1 Actual and Forecast Peak Loads

This table shows the monthly actual (A) peak loads for 2020 and for January and February of 2021, the forecast peaks for the remainder of 2021 and for 2022, and the summer and winter peak load forecasts for 2021 to 2030. Each category lists gross load, gross load minus load reductions attributable to behind-the-meter photovoltaics (BTM PV), and net load accounting for load reductions from BTM PV as well as energy efficiency (EE) measures. The compound annual growth rate (CAGR) is shown for the annual forecasts. Winter begins in December of the year shown. The values shown may not sum correctly due to rounding.

More information on the 2021 CELT forecast is available on the following ISO New England webpages:

Footnotes for Section 1.5.1

1. All monthly forecast values are from a probabilistic distribution of forecast peak loads. Seasonal peak month (January and July) values represent the 50/50 peak demand forecast, which is a value within the distribution that peak demand has a 50% probability of exceeding in any seasonal peak period. Values for all non-seasonal peak months reflect the 20/80 peak demand forecast, which is a value within the distribution that peak demand has an 80% probability of exceeding in each respective month.
2. All forecast values reflect the forecasted impact of electrification of the heating and transportation sectors.
3. Historical (actual) gross load values reflect CSOs for PDRs resulting from the primary FCA for the relevant CCP. Load reductions from active demand capacity resources are reconstituted into both net and gross load values.
4. Starting with the 2021 CELT, adjusted gross load forecast values are used in calculating the Installed Capacity Requirement for the ARAs. For each ARA, an adjustment is calculated, which is added on to the gross load forecast value for the capacity commitment period (CCP) in question. See Appendix A.1 for a table of these adjustments.
5. For monthly peak loads, the hour of the "gross" peak is often different than that for both "reduced for BTM PV" and "net" peak values during the cooling season due to the influence of BTM PV. Actual BTM PV output is typically zero at the time of the peak during winter months because winter peaks usually occur after sunset. Forecast values for BTM PV are, therefore, assumed to be zero for all months other than May to September.

1.5.2 Actual and Forecast Annual Energy Use

This table shows the actual (A) net energy for load (NEL) by month for 2020 and for January and February of 2021. Additionally, the forecasted monthly NEL for the remainder of 2021 and for 2022 are presented. Lastly, the net annual energy forecasts and compound annual growth rate (CAGR) for 2021 to 2030 are available. Each category lists gross load, gross load minus load reductions attributable to behind-the-meter photovoltaics (BTM PV), and net load accounting for load reductions from BTM PV as well as energy efficiency (EE) measures. The values shown may not sum correctly due to rounding.

Footnotes for Section 1.5.2

1. All forecast values reflect the forecasted impact of electrification of the heating and transportation sectors.
2. Net energy for load (NEL) is the net generation output within a balancing authority area, accounting for electric energy imports from other areas and subtracting energy exports to others. It includes system losses but excludes the electric energy required to operate pumped storage plants.
3. Historical (actual) gross load values reflect CSOs for PDRs resulting from the primary FCA for the relevant CCP. Load reductions from active demand capacity resources are reconstituted into both net and gross load values.

1.6 Seasonal Peak Load Forecast Distributions Accounting for Weather

This table shows the summer peak load distributions for 2021 to 2030 and the winter peak load distributions for 2021-2022 to 2030-2031, indicating the probabilities of a forecast being exceeded due to weather. The distributions use the gross forecast minus the load reductions attributable to BTM PV.

		Peak Load Forecast at Milder-than-Expected Weather				Gross Forecast at Expected Weather	Peak Load Forecast at Hotter-than-Expected Weather				
Probability of Forecast Being Exceeded		90%	80%	70%	60%	50%	40%	30%	20%	10%	5%

1.7 Electrification Forecast

Electrification forecasts quantify increases in electric consumption due to the electrification of the heating and transportation sectors. Table 1 contains a forecast of annual energy consumption; Table 2 lists expected summer peak impacts; and Table 3 lists expected winter peak impacts. Peak values reflect 50/50 load levels, which are values within the distribution that peak demand has a 50% probability of exceeding in each month. Demand and energy values include an 8% and 6% gross-up, respectively, to reflect avoided transmission and distribution losses. More information about the assumptions and methodology used in the final heating and transportation electrification forecasts is available at the ISO's Load Forecast Committee webpage:

2.1 List of Generators' Existing and Expected Seasonal Claimed Capability

This table presents the existing and expected seasonal claimed capability (SCC) for generators in the ISO New England Reliability Coordinator Area as of April 1, 2021. The winter SCCs are as of January 1, 2021, and the 2020-2021 winter peak SCCs are for December 17, 2020. The 2021 expected summer peak SCCs are for July 1, 2021, based on existing capacity as of the April 2021 SCC Report, and account for full and partial retirements pursuant to the Forward Capacity Market and the addition of generation expected to go into service by July 1, 2021. The in-service dates for new generation are based on the interconnection request queue (the queue) and information the lead participants provide to the ISO. For the expected summer peak SCC values, new photovoltaic and wind resources that do not have an SCC value due to a lack of historical generation data have an assumed summer SCC based on FCM qualified capacity (QC), if applicable. Otherwise, the ratings of new PV resources are assumed to be 44% of nameplate capacity (summer), and the ratings for new wind resources are assumed to be 16% of nameplate capacity (summer). SCC values may change during the year; refer to the ISOs monthly SCC reports.

Links: [Seasonal Claimed Capability Reports](#)

[Interconnection Request Queue](#)

Note that when an alternate fuel is listed, the generator may not be able to operate at full capability on the alternate fuel. Appendix A includes abbreviations, or links to the abbreviations, used for companies, generator type, and energy sources. Existing assets having no associated FCM resource as of April 1 are labeled with "NO RESOURCE" in the "Resource Name" field.

2.2 Net of Imports and Exports

This table shows the net capacity of imports and exports based on capacity supply obligations for the winter (January 1, 2021) and summer (June 1, 2021). A positive value indicates net imports and a negative value indicates net exports. Values shown may not sum correctly due to rounding.

Capacity imports from/exports to	Capacity (MW)	
	Winter	Summer
	1/1/2021	6/1/2021
Québec	496	499
New Brunswick	169	194
New York ⁽¹⁾	360	515
Net of imports and exports	1,025	1,208

Footnotes for Section 2.2

1. New York values for winter 2021 reflect a 100 MW Export Bid. This export is treated as a reduction to the generation CSO in Section 1.

2.3 Primary Natural Gas Pipeline Connection by Asset

This table shows each gas-fired asset's winter and summer seasonal claimed capability (SCC) categorized by its primary connection to a regional natural gas pipeline. Note that units in this list use natural gas as either a primary or a secondary fuel.

Pipeline Name	Asset ID	Asset Name	Jan 2021 Winter SCC (MW)	Jul 2021 Expected Summer SCC (MW)

3.1 Forecast of Photovoltaic Resources by Category and State

The PV forecast values shown in this table represent end-of-year installed capacities. The forecast reflects values after applying discount factors developed to account for a degree of uncertainty in future PV development. The values shown may not sum correctly due to rounding.

Forward Capacity Market PV consists of supply- or demand-side resources with capacity supply obligations, which may also be settlement-only resources (SORs). Non-FCM PV includes SORs and generators (per ISO Operating Procedure No. 14 [OP 14], Technical Requirements for Generators, Demand-Response Resources, Asset-Related Demands, and Alternative Technology Regulation Resources) that participate only in the energy market. Negative values in the non-FCM PV or BTM PV categories are due to the transfer of certain resources from those categories to the FCM PV category. An explanation of all PV forecast assumptions and methodology is available at the ISO’s Distributed Generation Forecast Working Group webpage.

3.2 Forecast of Cumulative Behind-the-Meter Photovoltaic Estimated Summer Seasonal (July 1) Peak Load Reduction by State

This table shows the forecast for each New England state and cumulative for the region for the estimated summer seasonal reductions in peak load attributable to behind-the-meter photovoltaics (BTM PV). These values are as of July 1 of each year and reflect the following factors:

- An 8% gross-up to reflect avoided transmission and distribution losses
- The application of discount factors developed to reflect a degree of uncertainty in future PV development
- The effects of an assumed 0.5% per year degradation rate for the PV panels
- The effect of diminishing PV production, as increasing PV penetrations shift the timing of peaks later in the day, which is reflected in the percentage of BTM AC nameplate values also shown in the peak-load reduction table

The July 1 values were calculated based on the cumulative growth percentage through June, as shown in the Monthly PV Growth table. Different planning studies may use different values based on the intent of the study. The BTM PV estimated summer seasonal peak-load reductions are reflected in line 1.1.1 of Section 1.1 for summer peak capabilities and load forecast. An explanation of all ISO New England PV forecast assumptions and methodology is available at the ISO's Distributed Generation Forecast webpage.

Monthly PV Growth Table (as a % of Annual Growth)

Month	1	2	3	4	5	6	7	8	9	10	11	12
Incremental	7%	6%	6%	6%	6%	7%	7%	8%	7%	9%	10%	22%
Cumulative	7%	12%	19%	25%	31%	38%	45%	53%	60%	69%	78%	100%

The above percentages are based on four years of historical installation data and reflect end of month values.

3.3 Forecast of Behind-the-Meter Photovoltaic Energy (GWh) by State

This table shows the forecast for BTM PV energy (GWh) by state. Monthly in-service dates of PV were assumed based on historical development. All values are grossed-up by 6.0% to reflect avoided transmission and distribution losses. The values also include the effects of an assumed 0.5% per year degradation rate for the PV panels. The gross BTM total for 2020 is used in Table 1.5.2, Actual and Forecast Annual Energy Use.

An explanation of all ISO New England PV forecast assumptions and methodology is available at the ISO’s Distributed Generation Forecast webpage.

4.1 Summary of Capacity Supply Obligations (MW)

This table presents the summer and winter capacity supply obligations (CSOs) for each load zone, the total for New England, the total for imports, and the total overall for each resource type for the 2020-2021 to the 2024-2025 capacity commitment periods. Resources that include co-located generation are included in the generation totals based on their resource type. All CSO values are current as of March 31, 2021. The values include all resources without distinction of qualification as a new capacity resource or existing capacity resource. The values are not capped by interface limits; delisted and retirement capacity (MW) have been removed. The passive demand capacity resource (DCR) numbers (which comprise energy efficiency and distributed generation measures) tabulated below are different from those listed as part of the energy efficiency (EE) forecast because the EE forecast uses qualified capacity (QC) from the third annual reconfiguration auction in year 1 of the forecast, and years 2 through 10 are forecast values.

4.2 Summary of Renewable Technology Resource Allotments in the Forward Capacity Market

This table shows the renewable technology resource (RTR) allotments (i.e., summer cleared capacity, allowance, and maximum allowance) for Forward Capacity Auction (FCA) 9 to FCA 15. Renewable technology resource qualified capacity is determined pursuant to Market Rule 1, Section III.13.1.1.2.10. The RTR maximum allowance value for FCA 15 was set to 514 MW (see FERC Docket No. ER18-619-000).

4.3 FCA 15 Qualified and Cleared Capacity

This table lists all the resources that qualified to participate in FCA 15, showing a variety of applicable parameters. These parameters include type of generating or demand capacity resource, state, load zone, dispatch zone, existing or new status, summer and winter qualified and cleared capacity. For generator resources, the fuel type, intermittent status, and generator type ID codes (see Appendix A.1) are included. For import resources, the interface name is included.

Terminations that may have occurred after the initial qualification are not reflected here.

Most of the data from this table can be found in the 2024-2025 Forward Capacity Auction Obligations spreadsheet (see link below). However, the generator type codes are from this CELT Report, Section 2.1 for existing generating units; the ISO-NE interconnection queue (pursuant to Schedules 22, 23, and 25 of the ISO's Open Access Transmission Tariff; OATT) for those future resources with a FERC-jurisdictional point of interconnection; and the Forward Capacity Tracking System for the remaining resources.

5.1 Network Resource Capability and Capacity Network Resource Capability; Effective June 1, 2021 for data as of April 1, 2021

This table lists the network resource capability (NRC) and capacity network resource capability (CNRC) values effective June 1, 2021, for data finalized as of April 1, 2021. For each resource, in addition to identification and location information, the table shows the summer and winter NRC and CNRC values, the instrument used to identify capability, and the lead participant. The CNRC will be different in later capacity commitment periods (CCPs) for certain resources that have obtained capacity supply obligations (CSOs) in later CCPs or have a cleared retirement or permanent delist bid in later CCPs. The NRC and CNRC values in this table reflect the capability established in accordance with the Open Access Transmission Tariff (OATT), Schedule 22, Section 1 or Schedule 23, Attachment 1. (Large Generator Interconnection and Small Generator Interconnection Procedures, respectively).

Pursuant to the OATT, Schedule 22, Section 5.2 or Schedule 23, Section 1.6.4, as applicable, the instrument used to identify the capability of the resource is either the Interconnection Agreement (IA), the Section 1.3.9 (or its predecessor provisions) Proposed Plan Application (PPA), or the historic capability of the resource. Cleared capacity refers to state jurisdictional interconnected resources that have obtained a CSO in the Forward Capacity Market (FCM). N/A means that the NRC values for these resources are captured in the Customer and Asset Management System as reported by the lead participant. "NO RESOURCE" means that there is an existing asset that has no associated resource in the 2021-2022 capacity commitment period. Because CNRCs are only applicable to the resource, this asset has no CNRC.

5.2 Demand Capacity Resource (MW) Used in System Planning Studies

This table shows the qualified capacity (QC) of existing demand capacity resources (DCR) and the cleared capacity supply obligations (CSO) of new DCR for FCAs 12, 13, 14, and 15 for each load zone for the 2021-2022 to 2024-2025 summer and winter capacity commitment periods. The information contained in this table is a snapshot in time immediately following each auction. The DCR values have been scaled up to include the 8% transmission and distribution loss gross up. Not all types of demand-side resources are reflected in all transmission planning studies. The use of DCR varies by the type of study, type of DCR, and load level being evaluated. Most transmission planning studies will reflect energy efficiency rather than other types of passive demand capacity resources. Additional details on the DCR modeled in transmission planning studies can be found in the Transmission Planning Technical Guide.

Footnotes for Section 5.2

1. Only active demand capacity resources are required to provide dispatch zone information because passive demand capacity resources are not dispatchable.

6.1 Transmission Project Links

The ISO New England RSP Project List and Asset Condition List show the primary drivers for system or equipment upgrades, the status and estimated costs for the upgrades, the projected in-service dates, and other features for each project. These lists are currently published three times per year, typically every March, June, and October, although publication times are subject to change. The lists are available at the ISO's Regional System Plan webpage. The Final Project List—March 2021 and Final Asset Condition List—March 2021 contain the prospective ISO New England transmission system considered part of the 2021 CELT Report.

Link: [*Regional System Plan Webpage*](#)

The ISO's Interconnection Request Queue (the queue) lists the status of requests for interconnecting new and modified (e.g., updated for increased capacity) FERC-jurisdictional generating facilities; the list is available at the queue's webpage.

Link: [*Interconnection Request Queue*](#)

Transmission owner local system plans (LSPs), which discuss projects within their individual areas, are updated at least once per year. The latest LSPs are available at the Transmission Owner Planning Advisory Committee webpage.

Link: [*Transmission Owner Planning Advisory Committee*](#)

6.2 Forecasts Used in Transmission Planning

The transmission system network models require data from the ISO's 90/10 forecast of gross summer peak load and the energy efficiency and PV forecasts, which are shown in this section for 2021 through 2030 for each load zone and system-wide.

Links: [Transmission Planning Technical Guide](#)

Footnotes for Section 6.2

1. The “gross” load forecast is from a probabilistic distribution of forecast peak loads without reductions resulting from energy efficiency and BTM PV. It represents the 90/10 peak demand forecast, which is a value within the distribution that peak demand has a 10% probability of exceeding in any summer period.
2. These values include an 8% gross-up to reflect avoided transmission and distribution losses.
3. The PV values reflected in this table are the sum of FCM PV, non-FCM PV, and Behind-the-Meter PV. Refer to Section 3.1 for the breakdown of total PV by category.
4. The forecast nameplate PV expected to be in service as of June 1 of the study year is used to represent the PV forecast in the summer peak load cases for that study year. For example, a summer 2021 peak load case will include a forecast of nameplate PV expected to be in service as of June 1, 2021.
5. Additional details on the modeling of the PV forecast in transmission planning studies are available in the Transmission Planning Technical Guide, Section 2.3.10.

Gross Load Forecast Adjustments for the ICR Calculations for Upcoming FCM Annual Reconfiguration Auctions

CCP	Reconfiguration Auction	Summer Adjustment (MW)	Winter Adjustment (MW)
2022-23	ARA 3	261	261
2023-24	ARA 2	120	120
2024-25	ARA 1	61	61

Prime Mover / Generator Type

CC	Combined cycle total unit— Includes generators which the EIA defines as: <ul style="list-style-type: none"> • Combined cycle steam part (CA); • Combined cycle single shaft (CS—combustion turbine and steam turbine share a single generator); • Combined cycle combustion turbine part (CT)
GT	Combustion (gas) turbine—simple cycle (includes jet engine design)
CE	Compressed air energy storage
ES	Energy storage, battery
FC	Fuel cell—electrochemical
HDP	Hydraulic turbine—conventional—daily, pondage (includes turbines associated with delivery of water)
HDR	Hydraulic turbine—conventional—daily, run of river (includes turbines associated with delivery of water)
HW	Hydraulic turbine—conventional—weekly, pondage (includes turbines associated with delivery of water)
HTO	Hydraulic turbine—other (includes hydrokinetic tidal power technology)
PS	Hydraulic turbine—reversible (pumped storage)
HL	Hydraulic turbine—pipeline
IG	Integrated coal gasification combined cycle
IC	Internal combustion engine (diesel, piston, reciprocating)
OT	Other
PV	Photovoltaic
PB	Pressurized fluidized-bed combustion
ST	Steam turbine, including nuclear, geothermal, and solar steam (does not include combined cycle)
WT	Wind turbine

Energy Source

AB	Agricultural crop byproducts/straw/energy crops
BFG	Blast furnace gas
BIT	Anthracite coal and bituminous coal
BLQ	Black liquor
DFO	Distillate fuel oil, including diesel, No. 1, 2, and 4
JF	Jet fuel
KER	Kerosene
LFG	Landfill gas
LIG	Lignite coal
MSW	Municipal solid waste
MWH	Electricity used for energy storage
NG	Natural Gas
NUC	Nuclear uranium, plutonium, thorium
OBG	Other biomass gas—includes digester gas, methane, and other biomass gasses
OBL	Other biomass liquids
OBS	Other biomass solids
OG	Other gas
PC	Petroleum coke
PG	Gaseous Propane
PUR	Purchased steam
RFO	Residual fuel oil—includes bunker C, No. 5, and No. 6 (020, 030, 070, and 100)
SC	Coal synfuel—coal-based solid fuel processed by a coal synfuel plant, and coal-based fuels such as briquettes, pellets, or extrusions, which are formed from fresh or recycled coal and binding materials
SLW	Sludge waste
SUB	Subbituminous coal
SUN	Solar
TDF	Tire-derived fuels
WAT	Water at a conventional hydroelectric turbine
WC	Waste/other coal, including anthracite culm, bituminous gob, fine coal, lignite waste, and waste coal
WDL	Wood waste liquids, excluding black liquor—includes red liquor, sludge wood, spent sulfite liquor, and other wood-based liquids
WDS	Wood/wood-waste solids, including paper pellets, railroad ties, utility poles, wood chips, bark, and wood-waste solids
WND	Wind
WO	Waste/other oil, including crude oil, liquid butane, liquid propane, oil waste, re-refined motor oil, sludge oil, tar oil, or other petroleum-based liquid wastes
