

1 **DRAFT prepared by Chris Campany**

2
3 **Pathways for Adaptation and Building Resilience in Communities**
4 **and the Built Environment**
5

6 Vermont has had 10 federally-declared weather-related disasters since the initial Climate Action
7 Plan (CAP) was adopted in December, 2021.¹ While catastrophic flooding was the primary
8 disaster, landslides, wind, and severe winter storms also caused harm to individuals and families,
9 entire neighborhoods, municipalities, and critical public infrastructure. Vermonters were also
10 subject to extreme heat events, a less obvious but deadly health risk, as well as drought. We are
11 living the risks and hazards anticipated by climate assessments.

12
13 This plan update does not benefit from an in-depth characterization of the physical and mental
14 health, housing and shelter, and financial impacts of these disasters on individuals and
15 households that experienced these disasters. Nor does it capture the impacts on commercial and
16 non-profit enterprises, or municipalities, and the relative financial health of each post-disaster, or
17 disasters. It also doesn't benefit from a full understanding of how many homes have been
18 destroyed or rendered uninhabitable, how many people are living in substandard conditions
19 either directly or indirectly caused by the disasters, or how many people have been displaced
20 from their homes, communities, or even from the state. Understanding the breadth and depth of
21 climate disaster impacts should be priority going forward, but it is clear we are living what the
22 CAP and its underlying science and policy direction have anticipated. Critically, the climate
23 factors underlying these disasters have not been mitigated at the global scale. And while
24 mitigation measures have been taken to improve climate adaptation and resilience in Vermont,
25 the underlying settlement patterns that put large numbers of people and civic, economic, cultural,
26 and public infrastructure at risk have not changed to a meaningful degree. We know what the
27 risks are. We need the political, operational, and financial capacity to act.

28
29 For this plan update we focus on the following which are intended to address in the aggregate the
30 related climate adaptation and resilience pathways, strategies, and actions.

¹ <https://www.fema.gov/locations/vermont#declared-disasters>

- 31 • Information for decision making.
- 32 • Increased technical assistance for decision and action.
- 33 • Increased self-reliance at the household, municipal, and state levels.
- 34 • Recognition of housing as an essential element of community resilience.
- 35 • Detailed physical master and capital improvement planning of compact settlements,
- 36 coupled with capital investment and financing strategies, at local and state levels.
- 37 • Full integration of conservation, working lands, and development planning to effect
- 38 climate resilience and adaptation.
- 39 • Integrating actions required by recent statutes related to planning, housing, flood safety,
- 40 and conservation.

41

42 **Information for Decision Making**

43 To be meaningful and broad-based, adaptation and resilience decision making is necessary at
44 the individual, household, municipal, regional, and state levels. Each ultimately informs the
45 other and builds a stronger foundation for action. Information should be tailored for each of
46 these levels, and should be clear, concise, plainly written, and easily accessible. Decision
47 making tools that have been developed, such as the Municipal Climate Change Vulnerability
48 Indicators Tool, should be evaluated to determine the extent to which they are being actively
49 and effectively used by the target audience, and to identify any barriers to their ongoing use,
50 including relevance. Creating a clearing house of existing tools across topics (i.e., health,
51 emergency preparedness, food access, etc.) in a way that maximizes the accessibility and
52 visibility of each will create an opportunity for greater awareness among users of both their
53 availability, and further topics that can be explored.

54

55 **Increased Technical Assistance for Decision and Action**

56 Information can increase knowledge but it is essential to support decision making at all levels
57 that will ultimately lead to action. The increasing frequency and intensity of climate change-
58 driven risks necessitates greater decisiveness. Providing access to information, coupled with
59 effective facilitation and access to expertise to advise courses of action, can aid decisiveness.
60 That coupling is essential. Vermont is fortunate to have a strong network of public, non-
61 profit, and commercial entities that serve all levels. This network should be resourced and

62 reinforced, rather than reinvented, to provide decision-making support. Making people,
63 municipal governments, businesses, and non-profits aware of this network *within the context*
64 *of adaptation and resilience action* should be an ongoing effort. For example, the same local
65 conservation district that assists farmers with advice on nutrient management can also advise
66 a homeowner how to best manage their stream buffer to mitigate risks of bank erosion.
67 Health workers, in addition to providing regular care, could as a matter of regular practice
68 inform patients where cooling shelters are and when to go, and what should be included in a
69 “go bag” should the need to evacuate arise suddenly. Regional planning commissions can
70 encourage the development town plans that are more resilience and adaptation focused (too
71 often municipalities separate town plans from local hazard mitigation plans), and can lead by
72 example by prioritizing resilience in their future land use mapping.

73

74 **Increased Self-Reliance at the Household, Municipal, and State Levels**

75 We are “Vermont Strong,” but the disaster, recovery, and mitigation aid landscape is
76 changing with both the sheer frequency, intensity and scale of events, and the quantity, terms
77 and conditions of funding. For example, the mitigation funding the state and municipalities
78 receive in the wake of disaster, *after* damage is done, is orders of magnitude greater than
79 what is normally available in the absence of a disaster. Indications are that long-relied upon
80 funding formulas could change, requiring state and local government to provide more of their
81 own funding for recovery and mitigation. It is also possible, or likely, that federal disaster
82 declaration thresholds will be elevated, thus decreasing the likelihood that federal aid will be
83 made available.

84

85 At the household and business level, the catastrophic floods of 2023 and 2024 were severe
86 enough that federal Individual Assistance (IA) Disaster declaration thresholds were
87 exceeded. An IA declaration brings in federal resources to assist individuals and families,
88 and businesses, with recovery that otherwise would not be available, as Vermonters in towns
89 not included in the IA declarations discovered. This threshold, too, could and likely will
90 increase. As we have learned, IA assistance is insufficient to support full-recovery. By
91 design it is intended to be supplemented by local philanthropic and volunteer aid. It is
92 imperative that Vermont establish policies and protocols and recovery structures so

93 Vermonters know *before* disaster strikes what support they can anticipate so they can better
94 prepare beforehand. This will also establish a framework so state agencies, municipal
95 governments, non-profits, businesses – everyone involved in response and recovery work –
96 know their roles and responsibilities are when it comes to recovery of Vermonters, not just
97 infrastructure. *Preparation is a form of adaptation and essential to resilience.*

98
99 Increasingly, federal and state funding that is intended for mitigation and adaptation is being
100 directed to support property buyouts to prevent future damage caused by flooding, fluvial
101 erosion, or landslides. In fact, the majority of mitigation funding is going towards buyouts.
102 While these buyouts can result in community-scale flood hazard mitigation outcomes, most
103 are at the individual property level rather than a floodplain or river corridor level. This is of
104 great benefit to Vermonters whose property has been or could be damaged or destroyed.
105 However, it is imperative that Vermont and Vermonters invest our own resources into
106 community-scale flood adaptation and resilience, including growing up and away from flood
107 hazards and brook and river channel migration. This is essential to develop and protect our
108 civic, economic, cultural, and housing infrastructure in anticipation of more frequent and
109 intense events that threaten our historic settlements that will continue to lie in harm’s way.

110
111 **Recognition of Housing as an Essential Element of Community Resilience**

112 Vermont is in the midst of a full-blown housing crisis driven by high-demand and low-
113 supply. At the same time, large areas of the state have lost significant numbers of housing
114 units to flooding. Housing is a fundamental need. We need not only more housing, but
115 housing where it is best suited to mitigate against climate risks, and the right types of housing
116 for different life stages. The housing status quo threatens the resilience of our economy,
117 social well-being, health and health care system, education system, senior care, public safety,
118 and tax base, among others. The latest (June 2024) Vermont Housing Needs Assessment
119 concludes that 36,000 primary homes are needed in the state in 2025-2029.² Developing
120 such quantities of housing requires greater density as part of larger compact settlement
121 development (i.e. “smart growth”). While this strategy should make the most of our existing

² <https://accd.vermont.gov/housing/plans-data-rules/needs-assessmentment>

122 historic compact settlements, all new settlement must minimize flood hazard and landslide
123 risk.

124

125 **Detailed Physical Master and Capital Improvement Planning of Compact**
126 **Settlements, Coupled with Capital Investment and Financing Strategies at**
127 **Local and State Levels.**

128 Compact settlements must be well-planned, and require detailed physical master planning,
129 capital improvement and investment planning, and public financing strategies and tools to
130 create the conditions for development. Physical master planning takes into account the
131 appropriateness of land to support resilient development, and guides where infrastructure
132 ranging from water and wastewater, streets, power, and public spaces, should be located.
133 This will likely necessitate the development of public investment and system operations
134 structures that are intermunicipal, or regional, in nature. Solving this problem is foundational
135 to a broad array of state, regional, and local policy directives related to land use, energy
136 development and conservation, greenhouse gas reduction, land conservation, transportation,
137 education, and economic development.

138

139 **Full Integration of Conservation, Working Lands, and Development**
140 **Planning to Effect Climate Resilience and Adaptation**

141 Compact settlement planning should not be done in a vacuum. What happens in the
142 landscape around the compact settlement influences its success as a desirable place to live, as
143 well as its ability to both be a means of climate resilience and adaptation, and to be climate
144 resilient and adaptive itself. The infrastructure that supports the compact settlement must
145 promote resilience and be resilient. This includes accommodation of drinking water
146 wellhead protection areas, and wastewater disposal sites that minimize energy consumption
147 and minimize the risk of groundwater and surface contamination. Streets leading to, through,
148 and from the settlement should promote, not impair, quality of life. Any development
149 beyond the compact settlement should be well-planned so as not to exacerbate or create new
150 hazards, such as stormwater runoff or impairment of surface or groundwater. Forest and
151 habitat blocks, and habitat connectors, should be maintained and improved not only for the

152 habitat and working lands benefits, but also to sequester carbon and maintain land cover and
153 soils that mitigate greenhouse gases and flood and drought risks. Floodplain conservation
154 and improved floodwater access to the floodplain will help mitigate against both flood and
155 drought. Planning compact settlement with river and brook channel migration – fluvial
156 erosion – in mind is essential to avoid the state’s primary and most violent hazard. And
157 incorporating wildland fire-adapted community strategies into all aspects of development
158 planning will help mitigate a lesser known but increasing risk in New England and the
159 northeast.³

160

161 **Integrate Actions Required by Recent Statutes Related to Planning,** 162 **Housing, Flood Safety, and Conservation**

163 Integrating actions required by recently-passed statutes, rather than taking a piecemeal
164 approach, creates the opportunity to achieve more holistic and comprehensive plans and
165 actions to achieve climate adapted and resilient communities⁴. Taken together the statutes
166 modernize Vermont’s approach to regional and municipal planning to more uniformly and
167 specifically designate areas suitable for development, encourage the construction of more
168 housing where supported by infrastructure, establish the creation of a statewide land
169 conservation plan, and support state regulation of river corridors, conservation of wetlands,
170 planning for dam safety, and consideration of the efficacy of the current approach to flood
171 hazard regulation. If brought together at the regional scale, in collaboration with planning at
172 the municipal scale, the opportunity exists to:

- 173 • More intentionally plan for future land use that integrates conservation, flood safety,
174 compact settlement and housing, while also identifying gaps and needs for
175 infrastructure investment to make adaptive and resilient community development
176 possible.
- 177 • Establish a more robust correlation between conservation, development, and
178 infrastructure needs that transcends municipal boundaries.

³ <https://www.northeasternwildfire.net/fire-adapted-communities/>

⁴ Act 47 – HOME Act (<https://legislature.vermont.gov/bill/status/2024/S.100>); Act 181 Regional Planning Act (<https://legislature.vermont.gov/bill/status/2024/H.687>); Act 121 Flood Safety Act (<https://legislature.vermont.gov/bill/status/2024/S.213>); Act 59 Community Resilience and Biodiversity Protection Act (<https://legislature.vermont.gov/bill/status/2024/H.126>)

- 179 • Create a statewide land use map by stitching together the new regional future land use
180 maps, which can both guide development and tell the story of opportunities and
181 barriers to making a more adaptive and resilient Vermont possible.

182 There are also initiatives underway at the University of Vermont that can help tell the story
183 of where we are and where we need to go regarding adaptation and resilience. UVM is in the
184 process of mapping zoning at the municipal level, the presence and location of community
185 wastewater systems, and areas with flood hazard risks. By layering this information,
186 Vermonters will be able to see if the infrastructure and local regulations exist to support
187 development in areas best suited to resilience, especially flood resilience. It is anticipated
188 that much of the current supporting infrastructure, and zoning that tracks with that
189 infrastructure, presently directs development towards areas with relatively high flood risk.
